

The Japanese Way, the JGC Way

Oil and gas plants rank among the most complex systems created by man. To build plants such as these requires the procurement of a vast array of materials and equipment from companies around the world.

At project sites, JGC often supervises at the peak of construction more than 50,000 workers from more than 60 nations.

Communication is the key. When we speak to one another, we use our words and our hearts to initiate a dynamic interaction, binding people and technology together across nations, ethnicities and cultures.

With each new project come countless new difficulties. The larger the project, the greater the obstacles are. Yet each and every time, we resolutely stand up to the challenges, determined to carry out our most important mission: It is to bring prosperity to our clients and to the countries where we do business.
