

Falling in Love with a Job for Life

Just before university graduation, I ventured overseas alone. On that trip I sent a letter to JGC. I wrote that I wanted to experience more of the world first-hand. The idea that traveling the world would become my lifetime job filled me with hope and anticipation.

The first time I ever visited a construction site to check on the facilities I had helped design, I stood under the scorching sun

watching more than 50,000 laborers from more than 60 nations busily at work. Such a massive project from my flimsy drafting table designs had seemed like an impossible task.

Communicating with clients whose languages I could not understand, and whose cultures I have never lived in, is always nerve-racking. I tremble sometimes thinking of the vast amounts of equipment and materials

needed to build the plants. No matter how many years I work at JGC, the pressure never goes away.

This job is dynamic. We learn to choose the best from a myriad of options, and then fit everything together to realize our vision. As a plant engineering company, our greatest pride is taken in producing brilliance through technology.
